Donation maps go stale. This one heals itself.

Clothing-donation bins move, fill up, get hauled away, or land on a map fifty yards from where they actually sit. Most maps record a location once and then let it drift quietly out of date.

OpenDrop treats every pin as a living record. The people who actually stand in front of these bins are the ones who keep them accurate, confirming, correcting, and retiring spots as the real world changes. The result is a map you can trust when you have a trunk full of coats and twenty minutes to spare, and a small, quiet way to keep good textiles out of a landfill and in the hands of someone who needs them.

Real data to start. The community keeps it honest.

OpenDrop does not start from nothing. Every region is seeded from redistributable, first-party sources: OpenStreetMap, The Salvation Army, Planet Aid, USAgain, and Wearable Collections. Those listings are deduplicated with a geographic and fuzzy-name algorithm, so five entries for the same bin collapse into one trustworthy pin.

From there, the community takes over. Every pin carries a confidence score you can read at a glance:

Every confirm and deny vote updates that score in real time. Newer contributors carry less weight than long-standing ones, so no single motivated person can quietly rewrite the map, and a spot is only ever retired when the evidence that it is gone clearly outweighs the evidence that it is still there.

There is more at work than a simple thumbs-up. You can drag a misplaced pin to where it truly belongs (capped so it can never be walked across town, and optionally corroborated by an on-device location check), rate a spot's safety and bin condition, note how many bins are present, and add a photo. A scheduled re-sync with the original sources catches closures on its own, with a circuit breaker that refuses to mass-delete a whole region if a source hiccups.

From “I have clothes to give” to done, in five steps.

01

Open the map

Go to opendrop.site in any browser, on any device. Nothing to install, no account to make, no email to hand over.

02

Find a spot near you

Search a city or address, or tap “locate me.” Filter by what you need: drop bins, thrift stores, donation centers, mutual-aid closets, even resale and consignment if you would rather sell than give.

03

Trust, but verify

A pin’s color is the community’s confidence in it. Open any pin for hours, address, and one-tap directions before you drive out.

04

Give back to the map

Confirm a spot is still there, flag one that is gone, drag a misplaced pin to where it belongs, add one that is missing, rate safety and bin condition, or add a photo. Every small act makes the next person’s trip easier.

05

Drop off your clothes

By the time you head out, you already know how confident the community is that the spot is still there, that it is in good condition, and that it feels safe. Community photos give you an easy way to spot it when you arrive.

Built by a security person, on purpose.

No accounts

No login, no profile, no password to leak, because there is nothing about you the project wants to hold.

Your location stays yours

GPS is only ever an on-device yes or no check. The coordinates are never stored, correlated, or sold.

Every edit is verified

A lightweight, privacy-respecting challenge and per-visitor cooldowns keep spam and bad actors out, with no tracking required.

Photos are scrubbed

Uploaded images have their embedded location and camera metadata stripped before they are ever stored.

Nothing to hide

The entire codebase is public. You can read exactly how every one of these promises is kept.

Yours to keep

Export the whole open dataset any time, or run your own private copy end to end.

Free to use. Free to fork. Free to keep.

OpenDrop is free forever, and open all the way down. The code is licensed **AGPL-3.0**, so you can read it, run your own copy, and improve it, and anyone who runs a modified version as a service has to share their changes back. The map data is open under **ODbL** and you can export the whole thing whenever you like. Community submissions are released into the public domain. It was built this way deliberately, so it can be trusted, audited, and never quietly enclosed by anyone, including me.

CODE AGPL-3.0

DATA ODbL-1.0

SUBMISSIONS CC0 / Public domain

Transparent is not a marketing word here, it is a promise. We do not collect anyone's data for marketing, we do not profile you, and we never sell or share what little we touch. The one check we run, Cloudflare Turnstile, is a safe and anonymous test that confirms you are a real person without tracking you. Your data will never be used unethically or irresponsibly, and because the whole project is open, you never have to take my word for any of it.

Exactly how we handle your data

WHAT WE ASK YOU FOR	Nothing. No account, no name, no email, ever.
BOT CHECK • TURNSTILE	An anonymous “are you human” challenge. No tracking cookies, no cross-site profile, no image labeling.
YOUR IP ADDRESS	Used only as a salted, one-way hash to rate-limit abuse. Never tied to your identity, never sold.
LOCATION & GPS	An on-device yes or no proximity check. Your coordinates never leave your device and are never stored.
PHOTOS YOU UPLOAD	Location and camera metadata are stripped before anything is saved.
ANALYTICS & MARKETING	None. No ad trackers, no data brokers, no behavioral profiles.
YOUR RECOURSE	All of it is enforced in public code you can read, export, and self-host.

OpenDrop stands on a mountain of other people's generosity.

No one builds civic infrastructure alone. OpenDrop is possible only because so many communities chose to make their work open, and because so many organizations do the unglamorous work of keeping clothing in circulation.

OPEN MAPS & OPEN KNOWLEDGE

OpenStreetMap and its contributors, whose map and data are the very ground this is built on, and the **Wikimedia Foundation**, whose freely licensed imagery gives the map its face.

THE ORGANIZATIONS THAT KEEP CLOTHING IN CIRCULATION

Planet Aid, The Salvation Army, USAgain, Wearable Collections, the **American Red Cross**, and the countless local charities, thrift stores, church drives, and mutual-aid closets doing the real work on the ground.

THE OPEN-SOURCE SOFTWARE

Leaflet, PostgreSQL & PostGIS, Python & FastAPI, Docker, and the maintainers behind a hundred smaller libraries who never get thanked nearly enough.

*To everyone in the open-source and open-data world:
thank you. This is what your work makes possible.*
